Arduino, SQL, PHP (HTML for web page) Sensor monitoring station for IoT Entity-Relationship Diagram for Database (station, board, temperature, humidity and co2)

Database in phpMyAdmin

Arduino file to get sensor readings

```
// Envía temperatura humedad y CO2 a la base de datos
#include <DHT.h>
#include <ESP8266WiFi.h>
#include <ESP8266HTTPClient.h>
int IdNodeMcu = 4://SE MODIFICA DEPENDIENDO DEL SENSOR
// Objeto que representa el sensor de temperatura. Se conecta al pin D3
DHT dht(D3, DHT11);
// Datos para conectar el NodeMCU a la red WiFi
const char *red = "Tec-IoT";
const char *password = "spotless.magnetic.bridge";
// Dirección del servicio para entregar el dato del sensor
String urlBase = "http://10.48.98.171/monitor/grabar.php?temperatura=";
HTTPClient http;
WiFiClient clienteWiFi;
void setup() {
// // Puerto serial para depurar
 Serial.begin(9600);
  delay(1000);
  // Conectarse a la red
  Serial.println("\nConectando a la red");
  WiFi.mode(WIFI_STA);
  WiFi.begin(red, password);
  while (WiFi.status() != WL_CONNECTED) {
   delav(500);
   Serial.print(".");
```

PHP files for database connection

Running the codes

```
Conectado

Temperatura = 19.00°C

Humedad = 47.00%

Co2 = 572 ppm

http://10.48.88.161/monitor/grabar.php?temperatura=19.00&humedad=47.00&co2=572&IdNodeMcu=4

Código: 200

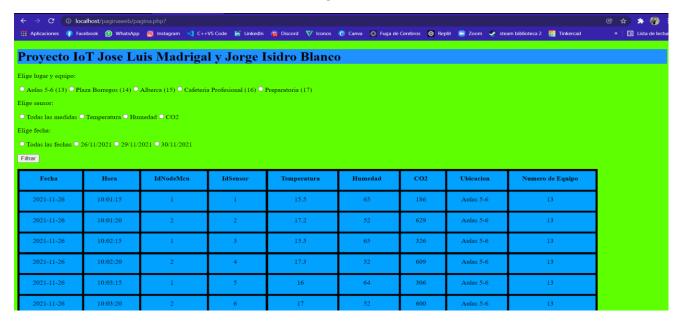

Temperatura 19.00, guardada correctamente en la BD Humedad 47.00, guardada correctamente en la BD CO2 5
```

This is Serial Monitor from Arduino (gets readings from NodeMCU, generates the URL and send it so the PHP can get the data from it, and then the code and message from the page is shown to verify they are in the database)

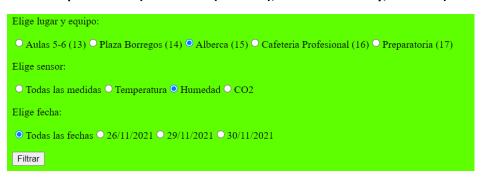

Web Page (one file for the menu with options and other for the filters)
